

Dear Valued Customer,

Birds inspire us because of their gift of flight. To soar across the wide blue sky is a liberating vision that stirs the human imagination. This is one reason why NamPost continues to celebrate birds in flight.

With their habit of hovering in one place while searching for prey, kites are particularly fascinating. They have motivated us to build our own kites on strings, which we dispatch into the sky to soar and hover on the wind – in a similar manner to the birds that inspired them.

Sincerely,
Hannelie Maasdorp

KITES OF NAMIBIA

DID YOU KNOW?

An animal species is defined as a population of like individuals that interbreed to perpetuate the genes of that population. A sub-species is a group of individuals with physical features differing from the overall population, but which are still capable of interbreeding with other individuals of the overall population. Yellow-billed kites and black kites are two subspecies of *Milvus migrans*.
